

ABSTRACT

A graft copolymer composition capable of producing a molded product retaining a satisfactory appearance over a long period of time and having abrasion resistance, scratching resistance and bending resistance. The graft copolymer composition contains a graft copolymer as the main component and a lubricant including a fatty acid amide or an alkylene oxide derivative. The graft copolymer includes an olefin polymer segment (a) and a vinyl polymer segment (b). Particles of one segment are dispersed in the other one segment. The diameter of the particles is 0.001 to 10 μm . The vinyl polymer segment (b) is formed from a polar vinyl monomer.
